

I am consultant endocrinologist and translational researcher at Section for Specialized Endocrinology, Oslo University Hospital, Oslo, Norway.

I received my medical degree in 2006 from the University of Iuliu Hațieganu, Cluj Napoca, Romania, and became a specialist in endocrinology in 2013. After defending my PhD thesis on the role of adipose tissue in acromegaly at the University of Oslo, in 2015, I became a postdoctoral fellow on a project aiming at characterizing non-functioning pituitary adenomas.

My current research focusses on molecular characterisation of pituitary adenomas, targeting novel biomarkers to predict their hormone secretion, aggressiveness, and response to medical treatment. I'm also interested in the role of adipose tissue on glucose metabolism and cardiovascular risk in endocrine diseases.

I have been working on the field of neuroendocrinology both clinically and in research for more than 15 years. Currently, in my clinical practice I treat patients with hypothalamic-pituitary diseases, endocrine genetic syndromes, adrenal diseases and secondary osteoporosis.

I was a board member in the European Neuroendocrine Association (ENEA) young research committee (EYRC) between 2019-2023. Moreover, I joined the EJE Rising Star team between 2022-2024. In 2022 I received Jens Sandahl Christiansen award.

I was a member of the program organising committee ENEA 2021 and 2018, ECE 2019 and Norwegian Society of Endocrinology, 2020 and 2019, and currently serve as a referee for several endocrine journals: EJE, Neuroendocrinology, JOE, JCEM, Endocrine Connections, ERC, and others.
